Model Documentation of the 'Perturbetd linear cable mass problem of order 20'

1 Nomenclature

1.1 Nomenclature for Model Equations

x	state vector
u	control input vector
w	noise vector
z	regulated output vector
y	measurement vector

2 Model Equations

State Vector and Input Vector:

$$x \in \mathbb{R}^1 20 u \qquad \in \mathbb{R}^1 w \in \mathbb{R}^1 z \qquad \in \mathbb{R}^3 y \in \mathbb{R}^2$$

System Equations:

$$\dot{x}(t) = Ax(t) + B_1 w(t) + Bu(t) \tag{1a}$$
$$z(t) = C_1 x(t) + D_{11} w(t) + D12 u(t) \tag{1b}$$
$$y(t) = Cx(t) + D21 w(t) \tag{1c}$$

Outputs: z

2.1 Exemplary parameter values

Parameters omitted due to large matrizes. See Source code.

3 Derivation and Explanation

This model is part of the "'COMPleib"' - library and wasautomatically imported into ACKREP.
The original description was:
CM3_IS To CM1_IS corresponding example of order 120, sd=9.5825e-003
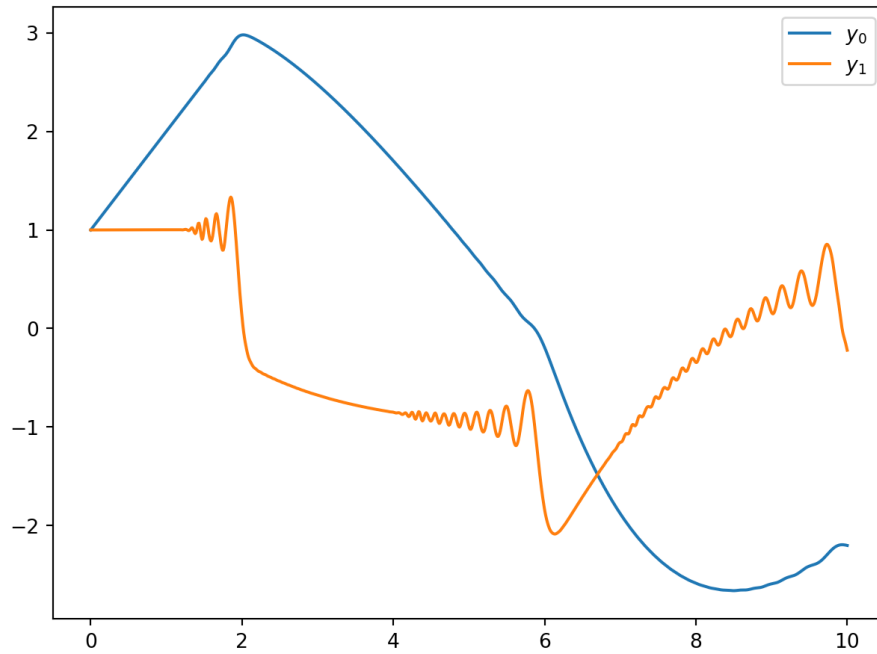

4   Simulation

Figure 1: Simulation of the Perturbetd linear cable mass problem of order 20.
